Two grammars of A'ingae glottalization

A case for Cophonologies by Phase

Maksymilian Dąbkowski
University of California, Berkeley

April 28, 2022

45th Generative Linguistics in the Old World Colloquium

introduction

abstract

language: A'ingae, or Cofán, an Amazonian isolate, ISO 639-3: **con**

data: phonological effects specific to

(i) morphological domains (strata)

(ii) idiosyncratic morphemes

⟩ (iii) they interact

implications: architecture of the morphology-phonology interface

model: Cophonologies by Phase (Sande et al., 2020)

glottal stop: the basics

(1) ʔ AS CONTRASTIVE IN ROOTS

a. *séje*
paint

b. *séʔje*
cure

(2) ʔ AS CONTRASTIVE IN FUNCTIONAL MORPHEMES

a. *tsá =ma*
ANA =ACC

b. *tsá -ʔma*
ANA -FRST

two morphophonological parameters

A'ingae suffixes:

1. belong to one of two domains ← organized stratally
   - either *inner*: assign (óσʔ) stress
   - or *outer*: ʔ has no effect on stress

$$\underbrace{[\ \textit{root} + \textit{inner suffixes}\ ]}_{\text{inner domain}}\ \underbrace{+\ \textit{outer suffixes}}_{\text{outer domain}}$$

2. belong to one of two dominance classes ← unpredictable
   - either *recessive*: preserve underlying stress
   - or *dominant*: delete input stress

2 × 2 = 4 emergent suffix types

	INNER	*OUTER*
RECESSIVE	*inner recessive*	*outer recessive*
DOMINANT	*inner dominant*	*outer dominant*

table 1: 2 × 2 = 4 emergent suffix types

inner dominant: delete stress and glottal stops

outer dominant: delete stress

the main takeaway

different phonological grammars associated with

(i) ordered morphological domains (strata)

(ii) lexically idiosyncratic morphemes

↖↘↙ (iii) they interact

a phonological formalism needs to model

(i) phonological stratification

(ii) morpheme-specific idiosyncrasies

↖↘↙ (iii) which interact

Cophonologies by Phase (Sande et al., 2020) lives up to the task

talk: the road map

1. introduction

2. language background

3. description

4. central generalizations

5. analysis

6. conclusion

language background

A’ingae (or Cofán): geography

Amazonian isolate, ISO 639-3: **con**

spoken by ca. 1,500 Cofán people in

- Sucumbíos, northeast Ecuador
- Putumayo, southern Colombia

A’ingae (or Cofán): geography

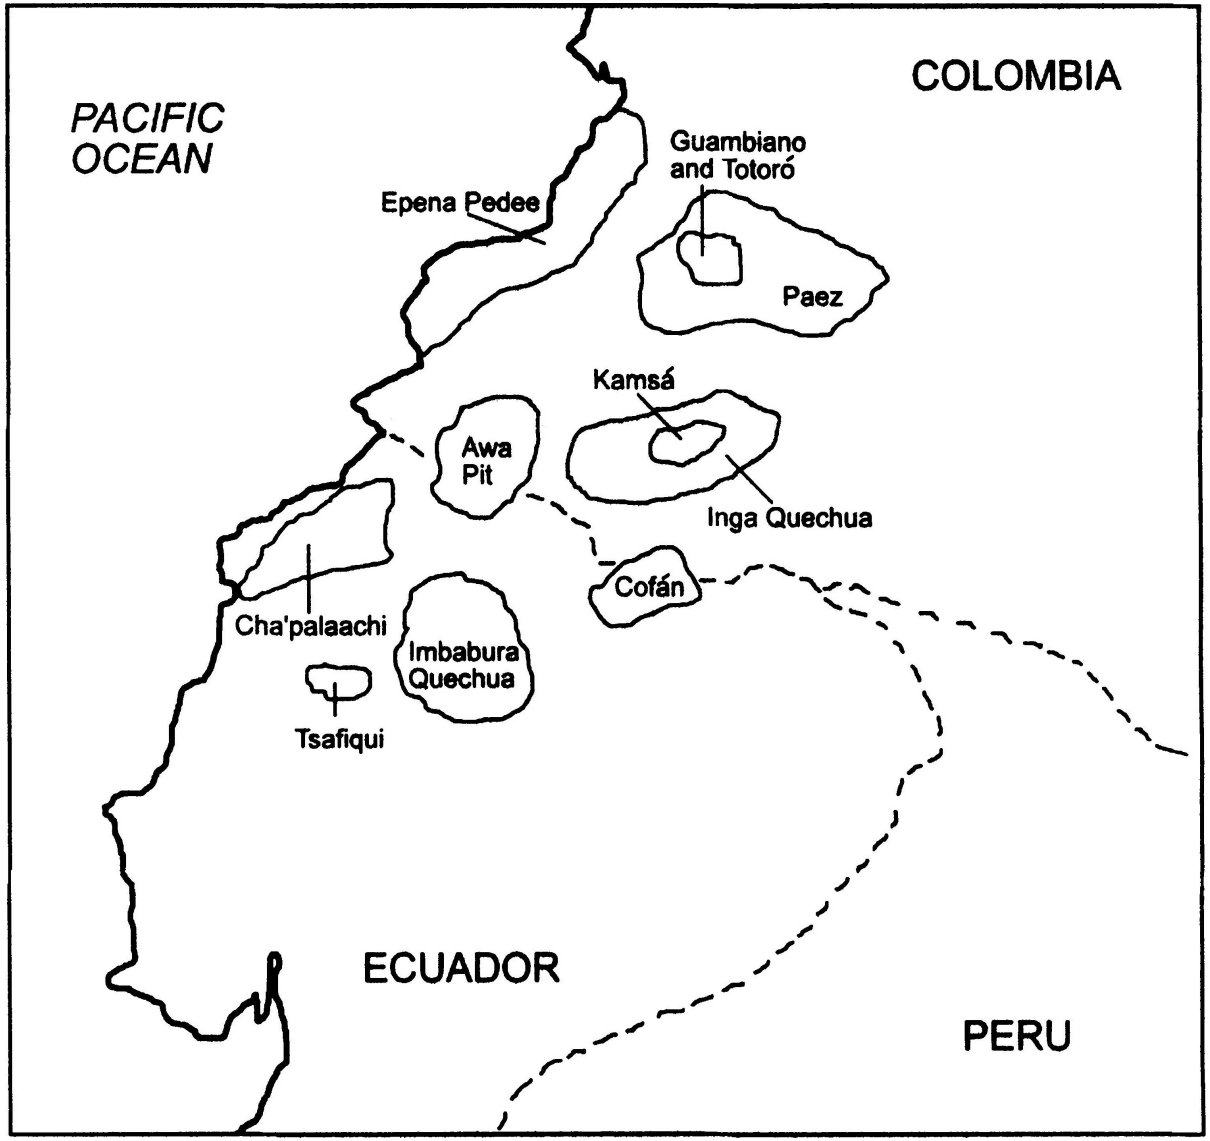

figure 1: indigenous languages of southern Colombia and northern Ecuador (Curnow and Liddicoat, 1998)

A’ingae (or Cofán): sociolinguistics

endangered and highly underdocumented

under economic, ecological, and political pressures

uniformly positive language attitudes (Dąbkowski, 2021)

data

- collected by author
- in 2021–2022
- with two consultants from Dureno, Sucumbíos, Ecuador

phonemic inventory

	LABIAL		ALVEOLAR		PALATAL		VELAR		GLOTTAL	
PLAIN STOPS	*p*	p	*t*	t			*k*	k	*ʔ*	ʔ
ASPIRATED STOPS	*ph*	pʰ	*th*	tʰ			*kh*	kʰ		
PRENASAL STOPS	*mb*	ᵐb	*nd*	ⁿd			*ng*	ᵑg

outer suffixes: a recap

outer recessive: *-ʔfa* PLS, *-ye* INF, *-ʔta* IF.SS, *-ja* IMP, *=ngi* 1, . . .

- if UR stressless, stress right edge of inner domain
- ʔ irrelevant to stress assignment

outer dominant: *-jama*$^{\varnothing}$ PRHB, *-kha*$^{\varnothing}$ IMP2

- previous stress deleted, ʔ preserved
- stress assigned to the left of the suffix

central generalizations

first central generalization

Stress assignment/deletion × glottalization interaction

For a given morphophonological domain, glottalization introduced in that domain interacts with stress if and only if stress-deletion interacts with glottalization.

inner domain:

- assign (σ́σʔ) stress
- stress deleting suffixes also delete ʔ

outer domain:

- ʔ has no effect on stress
- stress deleting suffixes do not delete ʔ

second central generalization

Dominance as the only lexical parameter

Upon controlling for preglottalization and the morphophonological domain, dominance is the only parameter needed to account for differences in the phonological processes triggered by particular suffixes.

dominant suffixes delete stress

- *inner dominant* suffixes
  - also delete ʔ — in the *inner* domain, stress interacts with ʔ
  - in the absence of ʔ, do not assign stress — true of the *inner* domain
  - otherwise, assign (σσʔ) stress — true of *inner* domain, including roots
- *outer dominant* suffixes
  - do not delete ʔ — in the *outer* domain, stress does not interact with ʔ
  - assign stress to their left — again, true of *outer* suffixes in general

analysis

model: Cophonologies by Phase (or CbP)

Cophonologies by Phase (or CbP) (Sande, 2017, 2019; Sande and Jenks, 2018; Sande, Jenks, and Inkelas, 2020)

cophonology $\stackrel{def}{=}$ a morphologically-specific phonological grammar

- a phase head $\longleftrightarrow$ a cophonology ($\mathfrak{R}$)
- a morphosyntactic feature bundle $\longleftrightarrow$ a cophonology ($\mathfrak{R}$)

phonological evaluation applies to morphological constituents, or phases

all cophonologies within a phase are compiled and added to the *master* ranking (Anttila, 2002)

after spell-out, the phonology resets to the (*master*) ranking

implementation

(i) lower phase heads $\longleftrightarrow$ *inner* cophonology:
? licensed by metrical structure – assigns (σσ?) stress

higher phase heads $\longleftrightarrow$ *outer* cophonology:
? licensed by syllables – no effect of glottalization on stress

(ii) dominant suffixes $\longleftrightarrow$ *dominant* cophonology:
requires stress deletion

(iii) interaction: phase head cophonology × morpheme cophonology

Cophonologies by Phase captures the two central generalization

four phases

four phase heads: *v*, Asp, T, C

(31) Feature-cophonology mappings in A'ingae, first iteration

a. *v*, Asp $\longleftrightarrow$ { $\mathfrak{R}$: *inner* }

independent non-phonological evidence for *v*, Asp, T, C as morphosyntactic constituents

first phase: *v*P

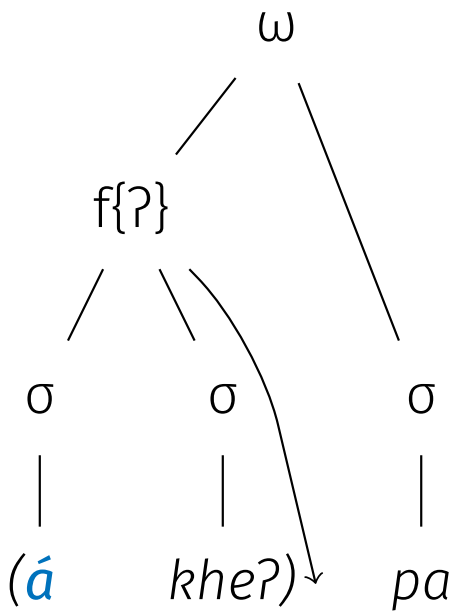
chop

b. / *ákheʔpa* /
[*ákheʔpa*]
forget

c. / *ánsaʔnge* /
[*ánsaʔnge*]
be shy

inner: autosegmental licensing of ʔ

(44) FOOT LICENCING ʔ IN THE INNER DOMAIN



(45) FOOT{ʔ}, or: f{ʔ}
Glottal stops are licensed by metrical feet. Assign a violation mark for every glottal stop not licensed by a metrical foot.

(Goldsmith, 1990)

inner: prosodic licensing + other constraints

(46) DISYLLABIC GLOTTALIZED ROOTS

a.	b.	c.
/ *seje,ʔ* /	/ *fithi,ʔ* /	/ *kani,ʔ* /
[***séʔ***je]	[***fíʔ***thi]	[***káʔ***ni]
cure	kill	enter

(47) TRISYLLABIC GLOTTALIZED ROOTS

a.	b.	c.
/ *akhusha,ʔ* /	/ *akhepa,ʔ* /	/ *ansange,ʔ* /
[***á***khuʔsha]	[***á***kheʔpa]	[***án***saʔnge]
chop	forget	be shy

(48) MAXIMALITY(ʔ), or: MAXʔ

For every ʔ in the input, there is a corresponding ʔ in the output.

(49) DEPENDENCE(FOOT), or: DEPf

For every metrical foot in the output, there is a metrical foot in the input.

(50) ALIGN(ʔ-R, FOOT-R), or: ALIGN-ʔ)

Every glottal stop is right-aligned with a metrical foot.

(51) NONFINALITY(ʔ), or: NONFINʔ

A glottal stop is not final in a prosodic word.

inner: disyllabic glottalized roots

			vP : *inner*				
(52)		*seje,ʔ*	f{ʔ},	MAXʔ,	NONFINʔ ⟩⟩	DEPf,	ALIGN-ʔ)
	i.	*seje*		*			
	ii.	*seje,ʔ*	*				*

	iv.	*(séjeʔ)*			*	*	
		cure					

inner: trisyllabic glottalized roots

(53)		*akhepa,ʔ*	vP: *inner* f{ʔ},	MAXʔ,	NONFINʔ ⟩⟩	DEPf,	ALIGN-ʔ)
	i.	*akhepa*		*			
	ii.	*akhepa,ʔ*	*				*
	iii.	*(áʔkhe)pa*				*	*
☞	iv.	*(ákheʔ)pa*				*	
	v.	*a(khéʔpa)*				*	*
	vi.	*a(khépaʔ)*			*	*	
		forget					

inner: alternating glottalized roots

(54) ALTERNATING GLOTTALIZED ROOTS: (C)V.ʔV

a. *kú́.ʔi*
drink

b. *tsá.ʔu*
house

c. *á.ʔi*
person

(55) ... WITH AN INFLECTIONAL SUFFIX: (C)V.ʔV

a. *kú́.ʔi -ji*
drink -PRCL

b. *tsá.ʔu -mbi*
house -NEG

c. *á.ʔi -mbi*
person -NEG

(56) ... WITH THE INNER *-ÑA* CAUS: (C)VVʔ

a. *kúíʔ. -ña*
drink -CAUS

b. *tsáuʔ. -ña*
house -CAUS

inner: bare alternating roots

(57)		*kûi,ʔ*	vP : *inner* f{ʔ},	NonFinʔ ⟩⟩	Align-ʔ)
	i.	*kûi,ʔ*	*		*
	ii.	(*kúiʔ*)		*	
☞	iii.	(*kú.ʔi*)			*
	iv.	(*kú.iʔ*)		*	
		drink[1]			

[1] the analysis builds on Repetti-Ludlow et al.'s (2019), who propose that glottalization is underlyingly word-final and undergoes metathesis to avoid non-finality, e. g. /*tsauʔ*/ → [*tsaʔu*] 'house'

inner: alternating roots + *v*P suffixes

(58) PARSESYLLABLES, or: PSYLL
Assign a violation mark for each unfooted syllable in the output.

(59)

master ⨁ *inner:*

f{?}, { Maxf, Max?, Lin? } ⟫ Depf ⟫ { NonFin?, PSyll } ⟫ Align-?)

dominant: AntiMaximality

AntiMaximality × licensing interaction

The deletion of a licenser entails the deletion of its licensees.

(70) AntiMaximality(Foot$_{\downarrow}$), or: AntiMaxf$_{\downarrow}$
It is not the case that for every metrical foot in the input, there is a corresponding metrical foot or a segment licensed by that foot in the output.
I. e., if there is one, delete (at least) one metrical foot, including its licensees, in the mapping from input to output.

(Alderete, 1999, 2001)

inner dominant suffixes deleting stress

(71)		*[(áfa)se]-khu*	AspP : *inner* ⊕ *dominant* ANTIMAXf$_{\downarrow}$ ⟩⟩	MAXf,	DEPf

all cophonologies: a recap

(89) Phonological rankings in A'ingae, final iteration

a. *master:* { Maxf, Max?, Lin? } ⟩⟩ Depf ⟩⟩ PSyll, NonFinσ́, NonFin?

b. *inner:* f{?}, { NonFin?, PSyll } ⟩⟩ { Align-?) }

c. *outer:* σ{?}, { Maxf, NonFinσ́, LxWd≈PrWd } ⟩⟩ Align-σ́] ⟩⟩ Depf

d. *dominant:* AntiMaxf$_{\downarrow}$ ⟩⟩ { Maxf, Max?, Lin? }

conclusion

conclusion i

stress assignment/deletion × glottalization interaction

- deletion of licenser entails deletion of licensees

dominance as the only lexical parameter

- *dominant* cophonology combines with *inner* or *outer*

	inner	*inner* ⊕ *dominant*	*outer*	*outer* ⊕ *dominant*
STRESS	preserved	deleted	preserved	deleted
GLOTTALIZATION	preserved	deleted	preserved	preserved
IF ABSENT OR DELETED, STRESS (RE)ASSIGNED	only due to glottalization: (σσʔ)		to the R-edge of spelled-out phrase	

table 7: interactions of the *inner*, *outer*, and *dominant* cophonologies

conclusion ii

organization of phonological grammar:

- morphological domains $\longleftrightarrow$ *inner* or *outer*
- individual affixes ($\longleftrightarrow$ *dominant*)

CbP implementation:

- morphological domains $\approx$ phase heads
- individual affixes $\approx$ morphosyntactic feature bundles

conclusion iii

typologically new application of CbP

previous extensive case study: Guébie (Sande, 2019)

- ATR harmony, vowel replacement, scalar tone shift
- monomorphemic words

current case study: A'ingae

- stress assignment, stress deletion, prosodic licensing
- subword domains of highly agglutinative verbs

Cophonologies by Phase affords insight into and successfully models formally different phenomena in typologically dissimilar languages

thank you!

My heartfelt thanks to my Cofán collaborators who have welcomed me to their community and shared their language with me. Thanks especially to Jorge Mendua, Shen Aguinda, Hugo Lucitante, Leidy Quenamá, and Raúl Quieta for the kindness and generosity they treated me with.

I would also like to thank Hannah Sande, Peter Jenks, Ricardo Bermúdez-Otero, Larry Hyman, Natalie Weber, Lev Michael, Scott AnderBois, Myriam Lapierre, Zachary O'Hagan, John Starr, Sam Liff, Wilson Silva, Uriel Cohen Priva, Gašper Beguš, Roman Feiman, Chelsea Sanker, Donca Steriade, Adam Albright, Kalinda Pride, and the audiences at CILLA IX, WCCFL 38, WCCFL 39, 28mfm, Amazônicas VIII, Zoom Phonology, Phorum, SSCircle, and ALDP for helpful discussions and their invaluable feedback.

My research was supported in part by a Royce Fellowship grant for the project "A'ingae language preservation" and an Oswalt Endangered Language Grant for the project "Phonology-syntax interface in A'ingae."
